Long-term experience with digital variometersystems of different generations at
Wingst observatory. Reprint of (SCHULZ, 1998a) by courtesy of GFZ Potsdam
CDrom

Preface

The present edition of the report series „Berichte des Bundesamtes für Seeschifffahrt und Hydrographie (BSH)" contains the geomagnetic data for the period from 1996 to 1999 presented by Erdmagnetisches Observatorium Wingst (Wingst Geomagnetic Observatory, WNG). Since the end of this reporting period, Wingst Observatory has been under the supervisory control of GeoForschungsZentrum Potsdam (GFZ). Thus, after more than six decades, the precise observation and complete recording of the Earth's geomagnetic field has ceased to be a task performed by a maritime institution:

- | | |
|----------------------|--|
| - from 1938: | Deutsche Seewarte (Maritime Observatory) |
| - from 1945: | Deutsches Hydrographisches Institut (German Hydrographic Institute) |
| - from 1990 to 1999: | Bundesamt für Seeschifffahrt und Hydrographie (Federal Maritime and Hydrographic Agency) |

After GFZ has assumed responsibility for Wingst Observatory, the focus there is no longer on maritime issues. Nevertheless, BSH will fall back on Wingst data also in future; it will support the geomagnetic service by providing financial funding and contributing personnel.

A CDrom containing not only the data of the above reporting period but also a revised digital set of all data that have been published since the establishment of Wingst Observatory is included with the present report.

Dr. P. Ehlers
President and Professor

1 Introduction

This report contains the results of Erdmagnetisches Observatorium Wingst for 1996, 1997, 1998, and 1999 (year books No 42, 43, 44 and 45).

In the years under review, Bundesamt für Seeschifffahrt und Hydrographie additionally published on a monthly basis:

- a) Reports on geomagnetic indices and special geomagnetic events.
- b) Reports on preliminary daily and monthly means.

Preliminary monthly and annual mean values were prepublished in Deutsche Hydrographische Zeitschrift/ German Journal of Hydrography (SCHULZ, 1996; 1998b; 1999).

Geomagnetic data have been provided on a regular basis to the following institutions:

- a) International Ursigram and World Days Service (IUWDS), followed by the International Space Environment Service (ISES) in 1997: Geomagnetic indices and geomagnetic events (daily)
- b) International Service of Geomagnetic Indices (ISGI): Geomagnetic indices and special geomagnetic events (monthly and annually)
- c) World Data Centers for Geomagnetism: Microfiches of variation (until 1997), pulsation magnetogrammes, geomagnetic indices and one-minute values (annually)
- d) INTERMAGNET (Global near-real-time magnetic observatory network): One-minute values (reported data via METEOSAT, hourly; adjusted data via Email, on week days); Geomagnetic indices and one-minute values (CDrom, annually).

Indices and information on special events were made available through a telephone service on weekdays.

Phone: +49 4778 812152

The preliminary variations and indices can be found on the Internet on a real time basis (hourly updates) in graphical form at

<http://www.bsh.de/en/Marine%20data/Observations/Geomagnetism/obs.jsp>

or (update every 10 minutes):

http://www.gfz-potsdam.de/pb2/pb23/GeoMag/Other/BothObs_e.html

and in numerical form (update every 10 minutes, pass word required):

<ftp://wng@ftp.bsh.de/outgoing/boulder>

Definitive (compressed) data from 1939 onwards (minute values since 1981) can be found at:

<ftp://ftp.bsh.de/outgoing/wng>

The following list shows some additional selected links providing Wingst data:

Intermagnet (variations):

<http://www.intermagne.bgs.ac.uk/cgi-bin/imagform>

RWC Brussels (indices):

<http://sidc.oma.be/products/wng/index.php3>

WDC Kyoto (pulsations):

<http://swdcdb.kugi.kyoto-u.ac.jp:80/film>

WDC Copenhagen (variations):

<http://web.dmi.dk/fsweb/projects/wdcc1/obs.html>

2 General Remarks

Wingst Geomagnetic Observatory was established in 1938 as a successor to Marineobservatorium Wilhelmshaven (WLH). Since then, the station has been operated without interruption. The observatory's development is described by VOPPEL, 1988. The development of the modern recording devices is given by SCHULZ, 1998a (see appendix 3).

The observatory is located in the Lower Elbe area on top of an terminal moraine of the Saale glacial period (elevation 50 m). Its co-ordinates are:

	Latitude	Longitude
Geographic	53° 44.6'N	09° 04.4'E
Geomagnetic	54.2°	95.3°

Geomagnetic co-ordinates refer to DGRF (Definitive Geomagnetic Reference Field) 1980.

The following abbreviations are used throughout this report:

- X North component
- Y East component
- Z Vertical component (downward positive)
- H Horizontal intensity
- D Declination (eastward positive)
- I Inclination (downward positive)
- F Total intensity
- U North-west component
- V North-east component

Times are related to UTC (Co-ordinated Universal Time).

2.1 Recording systems

The results of this edition were derived from the following recording systems:

- a) Digital system for variations:

Suspended fluxgate magnetometer (FM) of type FGE(DMI) (U , V , Z): One-minute and hourly means; indices of activity from 1997 on
Proton precession magnetometer (PPM) of type V75(VARIAN) (F): One minute spot values for quality check only

- b) Photographic system for variations of type SCHULZE/LA COUR (D , H and Z ; 20 mm h^{-1}): Indices of activity up to 1996; geomagnetic events (ssc, sfe, bay) and substitute hourly means
- c) Photographic system for pulsations of type KIM762(KARMANN) (amplitude and phase characteristics see yearbook No 30 (1984)): Geomagnetic events (pc, pi)

2.2 Levels, standards and constants

The results of this edition refer to the International Magnetic Standard (IMS). The results of the yearbooks up to and including 1980 referred to the Observatory Standard (OBS), which was represented by the classic type base line instruments bound to their original locations and surroundings.

H , Z , and F are referred to the proton vector magnetometer (PVM) of type ASKANIA/V4931(VARIAN) on pier NW (section 3.2), D to the fluxgate theodolite (DI-flux) of type 010B(ZEISS)/MAG01H(BARTINGTON) on pier NE (section 3.1) of the absolute house. Both instruments are assumed to represent IMS.

The following equations apply to D (see yearbook No 37, 1991), H and Z (see yearbook No 38, 1992):

$$\begin{aligned} D_{\text{OBS}} &= D_{\text{IMS}} \\ H_{\text{OBS}} &= H_{\text{IMS}} + 6.7 \text{ nT} \\ Z_{\text{OBS}} &= Z_{\text{IMS}} + 11.1 \text{ nT}. \end{aligned}$$

The differences for the derived elements depend on the components, i.e. from 1996 to 1999:

$$\begin{aligned} F_{\text{OBS}} &= F_{\text{IMS}} + 12.8 \text{ nT} \\ I_{\text{OBS}} &= I_{\text{IMS}} - 0.15' \\ X_{\text{OBS}} &= X_{\text{IMS}} + 6.7 \text{ nT} \\ Y_{\text{OBS}} &= Y_{\text{IMS}} \end{aligned}$$

The following physical standards are available at Wingst. They guarantee the quality of data:

SCHWILLE (frequency, DCF77, 10^{-8})
 PATEK PHILIPPE and HOPF (UTC, DCF77)
 CROPICO VS10 (Voltage, $5 \cdot 10^{-6}$)
 GUILDLINE 100 Ohm (resistance, $5 \cdot 10^{-6}$)
 Helmholtz coil of high precision (magnetic field strength, 10^{-4})

For the determination of the magnetic induction, the IAGA-recommended gyromagnetic constant (RASMUSSEN, 1991) was used:

$$2\pi\tau^{-1} = 23.487203 \text{ nT s}$$

The azimuth marks were last checked by the German Geodetic Survey in 1995. Their values, related to the NE pier (R: 3504926.873, H: 5956702.028), are:

Azimuth mark	Azimuth
N	$11^\circ 38.36'$
NE	$13^\circ 23.19'$
W	$308^\circ 42.94'$

2.3 Special measurements

In the years under review, comparative measurements were carried out at Wingst and at the observatories Niemegk (NGK) and Fürstenfeldbruck (FUR). The station differences are as follows:

at	WNG minus	D	I	F
1996 FUR	FUR	+0.01'	-0.04'	
NGK	NGK	-0.21	+0.03	-0.7nT
WNG	NGK	+0.11	-0.19	+0.7
1997 NGK	NGK	+0.34	-0.01	+1.4
1998 FUR	FUR	+0.24	-0.16	-2.3
WNG	NGK	+0.11	-0.09	-0.2
1999 NGK	NGK	-0.13	-0.05	+1.0
NGK	NGK	+0.13	0.0	+1.0

3 Absolute measurements

The absolute measurements were reduced both according to the variations of the digital system (section 4) and - up to 1997 - according to those of the photographic system.

3.1 Declination and Inclination

Absolute measurements of D were made with the DI-flux on an approximately monthly basis. Also the determination of I was included in the measurement routine. Each measurement is based on a set of four positions. I was corrected by the pier difference of $-0.2'$ in the sense of NW minus NE. The differences $E=I-\arctg(Z/H)$ are shown in Tables 1.x (x means 1, 2, 3 or 4, respectively).

Additionally, relative measurements of D were carried out with the PVM according to the addition field method on a weekly basis. The mean differences d in the sense of PVM minus DI-flux of all pairs of measurements carried out on the same day were used as instrument constants. Their values are as follows:

	d	Number
1996	-23.85'	13
1997	-23.86	11
1998	-23.95	10
1999	-23.82	12

3.2 Horizontal intensity, vertical component and total intensity

Absolute measurements of H and Z were carried out with the PVM according to the compensation field method after each relative determination of D .

The magnetic induction vector is over-determined due to the measurement of three elements within the meridian plane. The difference $C=F-(H^2+Z^2)^{1/2}$ represents the measurements' inherent accuracy. The annual mean values of the error C amounted to:

	C in nT	Number
1996	0.2 ± 0.2	52
1997	0.2 ± 0.2	52
1998	0.3 ± 0.4	51
1999	0.2 ± 0.3	52

C is also shown in Tables 1.x

As a rule, the PPM of type V75 was used. This instrument shows a long-term drift of some 0.1 nT depending on the components (SCHULZ AND CARSTENS, 1979). Therefore, comparative measurements using the PPM of type V4931, which represents IMS (section 2.2), were carried out on a monthly basis. All base line values as well as the recorded minute spot values of F (section 4) are referred to this instrument.

4 Digital recording system

Minute mean values of the orthogonal components U , V , and Z as well as spot values of F were acquired by the primary digital system (V75 and FGE (No 125), section 2.1). The PPM is not only part of the recording system but also serves as an indicator of the PVM (section 3).

Owing to over-determination, outliers, jumps and short-term base line instabilities between the base line measurements of all three components could be detected (section 4.1) and, under certain conditions, automatically eliminated. The following equation applies to Wingst:

$$dF = 0.26 dU + 0.26 dV + 0.93 dZ.$$

Additionally, a fourth fluxgate was operated, which had been aligned in such a way that its W orientation satisfies the following equation:

$$dW = 0.578(dU + dV + dZ).$$

In this way, jumps and outliers of the secondary system could be monitored independently.

A second suspended FM of type FGE (No 126), an FM of type EDA FM100B and a PPM of type PPM105(EDA) were operated as stand-by devices in case of failure of the primary system.

4.1 Base line values

Tables 1.x show the base line values of the FGE125 referred to IMS. Figs. 1.x show the results in graphical form. Absolute measurements of D and I (DI-flux) are marked by circles, those of relative measurements as well as H and Z (PVM) by dots. I (derived from H and Z) is also displayed (dots).

To obtain base line values, the dependence of the measured elements D , H , I , and F on the recorded components U , V , and Z within the range of variations was developed up to terms of

second order. Minute mean values of the magnetometer and the base line instruments were processed, which had been synchronized within ± 5 s.

For 1995 to 1999, the base line values of the primary components refer to the following equivalent voltages E of the fluxgate compensation fields:

Component	E in mV (nominal)
U	12861
V	12613
Z	45463

4.2 Scale values, temperature coefficients and cross talk

Scale values and cross talk were traced back to the respective parameters of the old FM100C(EDA) system by employing stochastic methods, making use of strong variations during a substorm on April 7, 1995 (SCHULZ, 1998a; see also appendix 3). The following values apply to the primary components (FGE125):

	Scale Values in 10 nT/mV 1.000+	Cross Talk against FM100C in 10^{-3}	
U	$+10^{-3}(1.4 \pm 0.6)$	V: $+0.2 \pm 1.0$	Z: $+0.9 \pm 0.6$
V	$-10^{-3}(1.5 \pm 0.8)$	U: -0.7 ± 0.6	Z: -0.5 ± 0.4
Z	$+10^{-3}(0.8 \pm 0.4)$	U: -0.6 ± 0.4	V: -0.5 ± 0.6

Considering the respective values of the FM100C (see yearbook No 41, 1995), the absolute misalignments and errors of the scale values of the FGE125 fluxgates probably do not exceed the order of magnitude of 10^{-3} .

Temperature coefficients were neglected because the FGE double system had been installed in the old variometer room with almost perfect temperature control (contact thermometers, $\pm 0.03^\circ\text{C}$).

5 Data processing

The base line values (Tables 1.x) were smoothed by Batspline approximation in steps of 0.01' for D or 0.1 nT for H and Z , respectively (SCHOTT, 1992).

Hourly mean values were formed using 60 minute mean values of U, V, and Z (taken at minutes 00 to 59 UTC and centred at second 30) as well as 60 F spot values (taken at second 05).

The international quiet (Q) and disturbed (D) days were taken from the Göttingen (1996) and Potsdam (since 1997) Listings of ISGI, respectively.

The data were processed by a computer double system of type HP9000 330/360. Each workstation is connected to a data acquisition unit of type HP3852 and to BSH by X25 computer link. All necessary calculations including those for the yearbook were carried out by the workstation of type HP9000 360.

6 Indices

The indices presented in this edition (Files wng96.k to wng99.k and Tables 4.x) indicate the local disturbances of the geomagnetic field resulting from particle radiation. Their meaning in detail:

K: geomagnetic three-hourly index, quasi-logarithmic measure of the maximum disturbance in steps of 0 to 9; lower limit for *K* = 9: 500 nT.

sum: Sum of the eight three-hourly indices of a day.

Ak: Mean value of the equivalent amplitudes derived from the eight three-hourly indices. The mean value of the daily disturbance of the geomagnetic field is 2 *Ak* nT.

Ck: daily character figure derived from *Ak* and scaled from 0.0 to 2.5.

C: estimated daily character figure; scale: 0, 1, 2.

The indices were derived using the IAGA-recommended FMI-routine (Häkkinen, 1992).

7 Contents of the CDrom

The enclosed CDrom contains recorded minute values as well as derived (hourly, daily, monthly) mean values and indices for the reporting period. It also provides recalculated epoch values from 1939.5 on and those of Wilhelmshaven Observatory before then, a complete revised data set of hourly means (since 1943) and minute values starting 1981. A revised set of indices (since 1944) is also included.

Using a visualisation software, the one-minute, hourly and daily values located at data/19YY/hourYY and minYY, respectively, can be displayed as graphs.

Files and Directories on the Cdrom:
